

six: totalTillHundred

Our last completely new concept is a **while loop**.

It's a loop that executes until the condition no longer holds.

For example, you can tell someone to "keep running until you faint".

In code, that would be:

```
while(you haven't fainted yet):  
    keep running
```

Write a function that, given a number, returns a number that is a sum of all numbers from that number till 100.

Name this function **totalTillHundred()**.

Example: totalTillHundred(98) -> returns 297.
